

NESTING IN WRF

Kelly Werner

February 2019

What is a nest?

- A *finer-resolution* domain embedded in a coarser resolution domain, and run together with the coarser resolution domain
- Most input data are on the order of about 1 degree or $\frac{1}{2}$ a degree – You don't want to interpolate down to, say a 3 km domain from 1 degree.
- Enables running at a higher-resolution without:
 - Uniformly high-resolution over a large domain – VERY expensive
 - High resolution for a very small domain, with mismatched time and spatial lateral boundary conditions

What is a nest?

- Covers a portion of the parent domain, and is fully contained by the parent domain
- Driven along its lateral boundaries by the parent domain
- May feedback the computed values back to the parent domain

When Should I Use Nests?

- Need to simulate localized phenomena: convection, topography, landuse-forced, etc.
 - What resolution is necessary to resolve what you are interested in?
 - Input data resolution is too coarse by more than a factor of 5-10x
 - Would like to provide better boundary conditions for the area of interest
 - BC's for external sources are typically 3-6 hours and do not have tendencies for all predicted fields
 - Computing resources not available for uniform coverage

When Should I Use Nests?

When Should I Use Nests?

Types of Nesting

- Using a single input domain (met_em.d01*)
 - No met_em.d02* files are used
 - All fields are interpolated from the model coarse grid
 - Only recommended if nest is over the ocean
- Using multiple input domains
 - Each domain contains full input data files (including topography, landuse, etc.)
- Specified move
 - Build WRF with “2=preset moves”
 - Must specify every move
 - Can use, but tedious to set-up
- Automatic move
 - Build WRF with “3=vortex following”
 - Only for tropical cyclone tracking
 - Expensive for single large nest

Types of Nesting

One-way/two-way nesting

- Determined by the namelist parameter “feedback”
 - **feedback = 0** (turned off/one-way)

Lateral boundary conditions are fed to the nest, from the parent.

Types of Nesting

One-way/**two-way** nesting

- Determined by the namelist parameter “feedback”
 - **feedback = 1** (turned on/two-way)

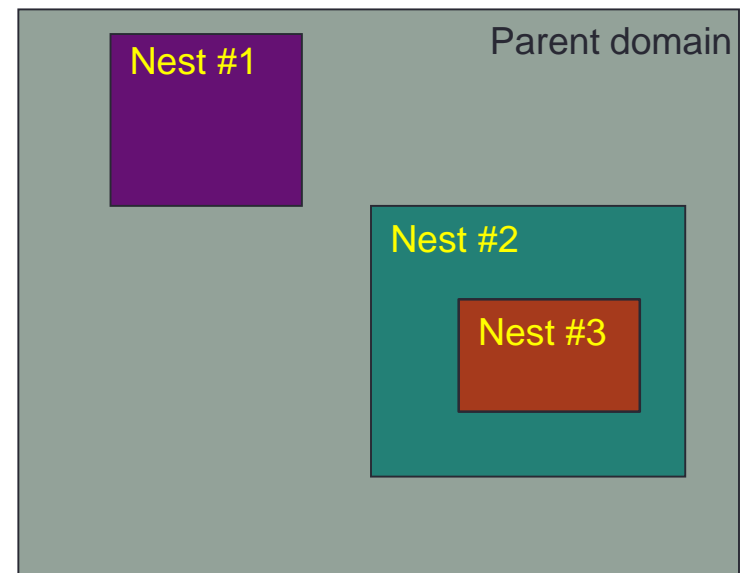

(1) Lateral boundary conditions are fed to the nest, from the parent.

(2) Child values are averaged, and then sent back to parent to overwrite value at corresponding grid point

Nests that are OK

Nests that are NOT OK

オーバーラッピングはだめ

Child domains *may not* have overlapping points in the parent domain (possible if Feedback is off).

Nests that are NOT OK

It's best to combine domains to create a single large fine-resolution nested domain

Nests that are NOT OK

Can add a higher-resolution domain if needed

Nesting Set-up and Run

Compiling for Nesting (WRF)

```

/

e_we and e_sn:

Each domain's full west-east and south-north dimensions

Notes:

- Domains should be no smaller than about 100x100
- Avoid placing any boundaries over complex terrain
- Keep nest away from coarse domain

namelist.wps set-up: *&geogrid*

&geogrid

```
parent_id      = 1,      1,  
parent_grid_ratio = 1,      3,  
i_parent_start  = 1,      70,  
j_parent_start  = 1,      67,  
  
e_we           = 175,    181,  
e_sn           = 145,    181,  
geog_data_res  = 'default', 'default',
```

```
dx              = 30000,  
dy              = 30000,  
map_proj        = 'lambert',  
ref_lat         = 37.0,  
ref_lon         = -97.0,  
truelat1        = 45.0,  
truelat2        = 30.0,  
stand_lon       = -97.0,  
geog_data_path  = '/data/static/geog/'
```

/

Minimum distance between nest boundary and parent boundary:

- 4 grid cells
- need MUCH larger buffer zone

- Good practice to have $\sim 1/3$ of coarse-grid surrounding each side of nest
- Nest can be placed a bit downstream of the inflow boundary

namelist.wps set-up: *&geogrid*

&geogrid

```

parent_id      = 1,      1,
parent_grid_ratio = 1,      3,
i_parent_start  = 1,      70,
j_parent_start  = 1,      67,

e_we           = 175,    181,
e_sn           = 145,    181,
geog_data_res   = 'default', 'default',

```

How to determine the nest grid numbers?

- Determine the beginning and ending locations for the nest on the parent domain
- Use the following to get these numbers:

(ending index – beginning index)*ratio+1
e.g. $(127-67)*3+1 = 181$

namelist.wps set-up: *&geogrid*

&geogrid

```
parent_id      = 1,      1,  
parent_grid_ratio = 1,      3,  
i_parent_start  = 1,      70,  
j_parent_start  = 1,      67,
```

```
e_we           = 175,    181,  
e_sn           = 145,    181,  
geog_data_res   = 'default', 'default',
```

```
dx              = 30000,  
dy              = 30000,
```

```
map_proj        = 'lambert',  
ref_lat         = 37.0,  
ref_lon         = -97.0,  
truelat1        = 45.0,  
truelat2        = 30.0,  
stand_lon       = -97.0,  
geog_data_path  = '/data/static/geog/'
```

dx and dy:

Only need the coarse domain resolution. The geogrid program calculates the nest resolution(s) using the “parent_grid_ratio”

Domain 1 の分辨率

*Note:

No changes need to be made to the &ungrib and &metgrid namelists records for nesting purposes

should match namelist.wps values

e_vert: 铅直格子数

All columns usually have the same value

dx/dy:

must set values for each domain.
make sure values correspond with
“parent_grid_ratio”
- for non-integer grid
resolutions, use at least two
decimal places

namelist.input set-up: *&domains*

&domains

.....

grid_id	= 1, 2, 3,
parent_id	= 0, 1, 2,
i_parent_start	= 1, 70, 30,
j_parent_start	= 1, 67, 30,
parent_grid_ratio	= 1, 3, 3,
parent_time_step_ratio	= 1, 3, 3,
feedback	= 1
smooth_option	= 0

All must be set to the same values
used in namelist.wps

feedback:

Whether a nest will overwrite
parent results

- 2-way nesting: feedback = 1
- 1-way nesting: feedback = 0

境界を smooth にし、
地形が複雑な場合。

parent_time_step_ratio:
See next slide!

namelist.*input* set-up: *&physics*

- You should use the same physics options for all domains for all schemes
 - **Exceptions:**
 - cumulus_scheme (cu_physics): may need to be turned off for a nest that has a grid distance of only a few kilometers
 - may turn off PBL scheme for resolutions close to 100 m
- Use same values for physics calling frequency parameters (for each domain)
 - radt: radiation time step
 - bldt: boundary layer time step
 - cudt: cumulus scheme time step

すべて 0 に してあげればよい

Computationally inexpensive –
no reason to not always set to
zero (run every time step)

Where do I start?

- Start with a namelist template provided in test/em_real (or WRF/run/)
- Use documentation to guide your namelist modifications
 - **README.namelist** (found in WRF/run/)
 - **examples.namelist** (found in WRF/test/em_real/)
 - **Users' Guide, Chapter 5**
 - http://www2.mmm.ucar.edu/wrf/users/docs/user_guide_v4/V4.0/users_guide_chap5.htm
 - **Namelist Best Practice web pages:**
 - WPS: http://www2.mmm.ucar.edu/wrf/users/namelist_best_prac_wps.html
 - WRF: http://www2.mmm.ucar.edu/wrf/users/namelist_best_prac_wrf.html
- Not all namelist options are domain dependent. If in doubt:
 - **Registry.EM_COMMON** or **registry.io_boilerplate** (found in WRF/Registry/)
 - **README.namelist**
 - grep for parameter names – look for “max_dom”
 - Rule of thumb: If default namelist only has 1 column, don't add values for other columns!

Successful Nested Run: WPS

- Modify namelist.wps for multiple domains (additional columns)
- Use same executables for running with a single domain
 - geogrid.exe output: `geo_em.d01.nc`, `geo_em.d02.nc`, etc.
 - ungrib.exe output: same as single domain – not domain dependent
 - metgrid.exe output: `met_em.d01*`, `met_em.d02*`, etc.

Successful Nested Run: WRF

- Modify namelist.input for multiple domains (additional columns)
- Link in the met_em* files and issue same executables for running with a single domain

real.exe output: real.exe が作成する

wrfbdy_d01

領域1のみ存在

- Lateral boundary data for all times (domain 01 only)

wrfinput_d01, wrfinput_d02, etc.

領域毎に存在

- Single time-level data at the model's start time (for each domain)
- 1 file per domain

wrf.exe output:

領域毎に作成

wrfout_d01*, wrfout_d02*, etc.

- One for each domain, for each history time (depending on 'frames_per_outfile')

wrfst_d01*, wrfst_d02*, etc.

- If "restart_interval" is less than or equal to the integration time

Summary

- Decide the best strategy to run your simulation
- If nesting is required, design your nest configuration
 - Design the coarse domain first
 - Determine the beginning and ending indices of the nest on the coarse domain
- Choose the appropriate nesting strategy:
 - one-way, two-way, or one-way via *ndown*

2 : 21 = 00
